DolphinSearch Unveils Most Powerful e-Discovery Solution

Ventura, CA – July 30, 2003 Already considered a leading provider of document discovery services for the legal profession, DolphinSearch, Inc. has just released a new version of its e-Discovery solution containing more than a dozen improvements over the current technology, DolphinSearch President, Andrew Kraftsow, announced today.

“You can’t rest on your laurels in this business,” Kraftsow said. “Our customers are top law firms serving Fortune 500 companies. We are determined to maintain the leadership position by continuing to make our e-Discovery services as fast, precise and cost-effective as possible.”

Among the advancements incorporated in the new Release 2.7.1 are the ability to search completed (indexed) documents in the system while other documents are being processed; the ability to batch (bulk) print metadata and/or documents either together or separately; the ability to conceal selected documents from other system users; the ability to email documents directly from the system to colleagues on a per-user permission basis and the ability to direct the system to find the earliest or latest metadata date field associated with a document, without knowing the names of all the date fields to check.

MORE

DolphinSearch –2

DolphinSearch delivers an entire spectrum of services law firms use to process documents for e-discovery.

“We understand what kind of speed and accuracy attorneys need and what complicates the discovery process,” Kraftsow said. “Our programmers have been able to eliminate many of the problems found in traditional solutions.”

Among the innovations introduced by DolphinSearch is the unique ability to filter out irrelevant messages, jokes and e-mails that frustrate the process. Another important feature is “Hyper-duping” which includes the capability to eliminate duplicate documents, review documents in context and maintain a consistency of coding. A third advantage built into DolphinSearch solutions is Native File Format Review, which allows users to review all documents in a spreadsheet in their original form instead of as a brief “snapshot”.

Kraftsow stated that DolphinSearch offers the most efficient solution available to attorneys today. “In a typical application, we can reduce discovery time by as much as 70% while providing incredible accuracy,” he said.

The DolphinSearch President said that product innovation and an increased customer base have contributed greatly to corporate growth. The company continues to show increased profits and the staff has doubled in the past six months.

DolphinSearch, Inc. is the leading developer of next generation technology that enables computers to analyze and process unstructured information. At the heart of this technology is a patented engine that enables computers to read with human-like understanding. Based upon 15 years of research, DolphinSearch is a text-reading robot powered by a computer model of the extraordinary pattern recognition capabilities of a dolphin’s brain. It delivers a tool that analyzes unstructured information the way a traditional database analyzes structured information. It turns information into knowledge.
